SYSTEM, METHOD AND COMPUTER PROGRAM PRODUCT FOR
AN IMPROVED PROGRAMMABLE VERTEX PROCESSING MODEL
WITH INSTRUCTION SET

RELATED APPLICATION

The present application is a continuation-in-part of applications entitled
“METHOD, APPARATUS AND ARTICLE OF MANUFACTURE FOR A
TRANSFORM MODULE IN A GRAPHICS PROCESSOR” filed December 06,
10 1999 under serial number 09/456,102 and attorney docket number
NVIDP010/P000127, and “SYSTEM, METHOD AND ARTICLE OF
MANUFACTURE FOR A PROGRAMMABLE VERTEX PROCESSING MODEL
WITH INSTRUCTION SET” filed May 31, 2000 under serial number 09/586,249
and attorney docket number NVIDP021/P000174, which are incorporated herein by
15 reference in their entirety.

FIELD OF THE INVENTION

The present invention relates to computer graphics, and more particularly to
20 providing programmability in a computer graphics processing pipeline.

BACKGROUND OF THE INVENTION

Graphics application program interfaces (API's) have been instrumental in
25 allowing applications to be written to a standard interface and to be run on multiple
platforms, i.e. operating systems. Examples of such graphics API's include Open
Graphics Library (OpenGL®) and D3D™ transform and lighting pipelines.
OpenGL® is the computer industry's standard graphics API for defining 2-D and 3-D
graphic images. With OpenGL®, an application can create the same effects in any
30 operating system using any OpenGL®-adhering graphics adapter. OpenGL®

specifies a set of commands or immediately executed functions. Each command directs a drawing action or causes special effects.

Thus, in any computer system which supports this OpenGL[®] standard, the operating system(s) and application software programs can make calls according to the standard, without knowing exactly any specifics regarding the hardware configuration of the system. This is accomplished by providing a complete library of low-level graphics manipulation commands, which can be used to implement graphics operations.

A significant benefit is afforded by providing a predefined set of commands in graphics API's such as OpenGL[®]. By restricting the allowable operations, such commands can be highly optimized in the driver and hardware implementing the graphics API. On the other hand, one major drawback of this approach is that changes to the graphics API are difficult and slow to be implemented. It may take years for a new feature to be broadly adopted across multiple vendors.

With the impending integration of transform operations into high speed graphics chips and the higher integration levels allowed by semiconductor manufacturing, it is now possible to make part of the geometry pipeline accessible to the application writer. There is thus a need to exploit this trend in order to afford increased flexibility in visual effects. In particular, there is a need to provide a new computer graphics programming model and instruction set that allows convenient implementation of changes to the graphics API, while preserving the driver and hardware optimization afforded by currently established graphics API's.

As the geometry pipeline becomes more and more accessible to the application writer, there is a further need for the ability to execute more and more specific functions on a high speed graphics chips. Traditionally, functions such as sine, cosine, exponentials, and logarithms have been carried out utilizing a central processing unit or a texture look-up operation. Unfortunately, such prior art

DISCLOSURE OF THE INVENTION

A system, method and computer program product are provided for branching
5 during programmable processing in a computer graphics pipeline. Initially, data is
received. Programmable operations are then performed on the data in order to
generate output. Such operations are programmable by a user utilizing instructions
from a predetermined instruction set. When performing the programmable
operations in the foregoing manner, programmable branching may take place
10 between the programmable operations. Subsequently, the output is stored in
memory.

In one embodiment, the programmable operations may be branched to labels.
Further, the labels may be stored in a table. The programmable operations may thus
15 be branched to indexes in the table. Further, each index may be stored in an address
register. As an option, each index may be calculated.

In another embodiment, the programmable operations may be branched
based on condition codes. Such condition codes may be sourced as EQ(equal),
20 NE(not equal), LT(less), GE(greater or equal), LE(less or equal), GT(greater),
FL(false), and/or TR(true). Optionally, the condition codes may be maskable.
Further, the condition codes may be swizzled.

In addition to being used during branching, the condition codes may be
25 utilized to control write masks. As an option, the write masks may be controlled
utilizing an AND operation involving the write masks and the condition codes.

In still another embodiment, the programmable operations may be terminated
after a predetermined number of operations have been performed to prevent the
30 computer graphics pipeline from hanging.

In use, the operations may include a branch operation, a call operation, a return operation, a cosine operation, a sine operation, a floor operation, a fraction operation, a set-on-equal-to operation, a set false operation, a set-on-greater-than, a set-on-less-than-or-equal operation, a set-on-not-equal-to operation, a set true operation, a no operation, address register load, move, multiply, addition, multiply and addition, reciprocal, reciprocal square root, three component dot product, four component dot product, distance vector, minimum, maximum, set on less than, set on greater or equal than, exponential base two (2), logarithm base two (2), exponential, logarithm, and/or light coefficients.

A system is thus provided for branching during programmable vertex processing. Included is a source buffer for storing data. Also included is a functional module coupled to the source buffer for performing programmable operations on the data received therefrom in order to generate output. Such operations are programmable by a user utilizing instructions from a predetermined instruction set. Coupled to the functional module is a register for storing the output. In use, the functional module is capable of branching between the programmable operations.

As mentioned earlier, various functions such as sine and cosine may be executed by the previous embodiment. To execute such functions, a system and method are provided for directly executing a function in a computer graphics pipeline. Initially, input data is received in the computer graphics pipeline. A mathematical function is directly performed on the input data in order to generate output data. It should be noted that the mathematical function is directly performed in the computer graphics pipeline without a texture look-up or significant or any aid from a central processing unit. Next, the output data is stored in memory on the computer graphics pipeline.

In one embodiment, the mathematical function may include a sine, cosine, or various other functions such as tangent, arctangent, exponent, logarithm,

antilogarithm, hyperbolic sine, hyperbolic cosine, hyperbolic tangent, and/or hyperbolic arctangent. Moreover, the input data may be in a floating-point format.

In use, the mathematical function may be performed utilizing a Taylor Series
5 or a cordic algorithm. Still yet, the input data may be converted from a first coordinate system to a second coordinate system. Further, the mathematical function may be carried out in one cycle in the computer graphics pipeline.

In another embodiment, after the input data is received, the particular
10 function to be executed on the input data may initially be identified. Thus, pre-processing of the input data may be carried out based on the function to be executed on the input data utilizing the computer graphics pipeline. Next, the input data may be processed utilizing a plurality of operations independent of the function to be executed on the input data utilizing the computer graphics pipeline. Subsequently,
15 post-processing may be carried out on the input data to generate output data utilizing the computer graphics pipeline. As mentioned earlier, such output data may be stored in memory on the computer graphics pipeline.

In one aspect of the present embodiment, the pre-processing may include
20 adding a one (1) to the phase (*i.e.*, the quadrant) of the input data if the function to be executed on the input data is cosine. Moreover, the pre-processing may include multiplying the input data by $(1/(2\pi) + 1)$ if the function to be executed on the input data is either sine or cosine. Still yet, the pre-processing may include performing a conditional 1's complement operation on the input data if the function to be
25 executed on the input data is either sine or cosine. As an option, the pre-processing may include performing a barrel shift operation on the input data if the function to be executed on the input data is the exponent operation. It should be noted that the $\sin(x)$ and $\cos(x)$ functions may include an argument x that is in either degrees or radians.

30

In another aspect of the present embodiment, the processing may include extracting a set of most significant bits and a set of least significant bits from a mantissa associated with the input data. Further, the processing may include conditionally adding a one (1) to the most significant bits. As an option, the processing may include looking up information in a plurality of tables, and calculating a Taylor Series. Such information may include a plurality of derivatives for being summed in the Taylor Series. As an option, the tables may be utilized based on the function to be executed on the input data. Moreover, the tables may be hard-coded or programmable, and loaded at runtime.

5

10

These and other advantages of the present invention will become apparent upon reading the following detailed description and studying the various figures of the drawings.

15

BRIEF DESCRIPTION OF THE DRAWINGS

5 The foregoing and other aspects and advantages are better understood from the following detailed description of a preferred embodiment of the invention with reference to the drawings, in which:

Figure 1 is a conceptual diagram illustrating a graphics pipeline in accordance with one embodiment of the present invention;

10

Figure 2 illustrates the overall operation of the various components of the graphics pipeline of Figure 1;

15

Figure 3 is a schematic illustrating one embodiment of a programming model in accordance with the present invention;

20

Figure 4 is a flowchart illustrating the method by which the programming model of Figure 3 carries out programmable vertex processing in the computer graphics pipeline; and

Figure 5 is a flowchart illustrating the method in a data structure is employed to carry out graphics instructions in accordance with one embodiment of the present invention.

25

Figure 6 illustrates a method for directly executing a function in a computer graphics pipeline.

30

Figure 7 illustrates a method for pre-processing input data, in accordance with the process of Figure 6.

Figure 8 illustrates a method for processing input data, in accordance with the process of Figure 6.

Figure 9 illustrates a method for post-processing input data, in accordance
5 with the process of Figure 6.

10

FIGURE 8

DESCRIPTION OF THE PREFERRED EMBODIMENTS

Figure 1 is a conceptual diagram illustrating a graphics pipeline 100 in accordance with one embodiment of the present invention. During use, the graphics pipeline 100 is adapted to carry out numerous operations for the purpose of processing computer graphics. Such operations may be categorized into two types, namely vertex processing 102 and primitive processing 104. At least partially during use, the vertex processing 102 and primitive processing 104 adhere to a standard graphics application program interface (API) such as OpenGL® or any other desired graphics API.

Vertex processing 102 normally leads primitive processing 104, and includes well known operations such as texgen operations, lighting operations, transform operations, and/or any other operations that involve vertices in the computer graphics pipeline 100.

Primitive processing 104 normally follows vertex processing 102, and includes well known operations such as culling, frustum clipping, polymode operations, flat shading, polygon offsetting, fragmenting, and/or any other operations that involve primitives in the computer graphics pipeline 100. It should be noted that still other operations may be performed such as viewport operations.

Figure 2 illustrates a high level operation 200 of the graphics pipeline 100 of Figure 1. As shown, it is constantly determined in decision 202 whether current operation invokes a programmable geometry model of the present invention. If so, a mode is enabled that partially supercedes the vertex processing 102 of the standard graphics API, thus providing increased flexibility in generating visual effects. See operation 204.

When disabled, the present invention allows increased or exclusive control of the graphics pipeline 100 by the standard graphics API, as indicated in operation 206. In one embodiment, states of the standard graphics API state may not be overruled by invoking the programmable geometry mode of the present invention.

5 In one embodiment, no standard graphics API state may be directly accessible by the present invention.

In one embodiment of the present invention, the programmable geometry mode of the present invention may optionally be limited to vertex processing from object space into homogeneous clip space. This is to avoid compromising hardware performance that is afforded by allowing exclusive control of the primitive processing 104 by the standard graphics API at all times.

The remaining description will be set forth assuming that the programmable geometry mode supersedes the standard graphics API only during vertex processing 102. It should be noted, however, that in various embodiments of the present invention, the programmable geometry mode may also supersede the standard graphics API during primitive processing 104.

20 Figure 3 is a schematic illustrating one embodiment of a programming model 300 in accordance with the present invention. Such programming model 300 may be adapted to work with hardware accelerators of various configuration and/or with central processing unit (CPU) processing.

25 As shown in Figure 3, the programming module 300 includes a functional module 302 that is capable of carrying out a plurality of different types of operations. The functional module 302 is equipped with three inputs and an output. Associated with each of the three inputs is a swizzling module 304 and a negating module 306 for purposes that will be set forth hereinafter in greater detail.

30

Coupled to the output of the functional module 302 is an input of a register 308 having three outputs. Also coupled to the output of the functional module 302 is a vertex destination buffer 310. The vertex destination buffer 310 may include a vector component write mask, and may preclude read access.

5

Also included are a vertex source buffer 312 and a constant source buffer 314. The vertex source buffer 312 stores data in the form of vertex data, and may be equipped with write access and/or at least single read access. The constant source buffer 314 stores data in the form of constant data, and may also be equipped with write access and/or at least single read access.

10

Each of the inputs of the functional module 302 is equipped with a multiplexer 316. This allows the outputs of the register 308, vertex source buffer 312, and constant source buffer 314 to be fed to the inputs of the functional module 302. This is facilitated by buses 318.

15

Figure 4 is a flowchart illustrating the method 400 by which the model of Figure 3 carries out programmable vertex processing in the computer graphics pipeline 100. Initially, in operation 402, data is received from a vertex source buffer 312. Such data may include any type of information that is involved during the processing of vertices in the computer graphics pipeline 100. Further, the vertex source buffer 312 may include any type of memory capable of storing data.

20

Thereafter, in operation 404, programmable operations, i.e. vertex processing 102, are performed on the data in order to generate output. The programmable operations are capable of generating output including at the very least a position of a vertex in homogeneous clip space. In one embodiment, such position may be designated using Cartesian coordinates each with a normalized range between -1.0 and 1.0. As will soon become apparent, branching may occur between the

25

programmable operations. Further, conditional codes may be used during the course of such branching, as well as in conjunction with write masks.

5 The output is then stored in the register 308 in operation 406. During operation 408, the output stored in the register 308 is used in performing the programmable operations on the data. Thus, the register 308 may include any type of memory capable of allowing the execution of the programmable operations on the output.

10 By this design, the present invention allows a user to program a portion of the graphics pipeline 100 that handles vertex processing. This results in an increased flexibility in generating visual effects. Further, the programmable vertex processing of the present invention allows remaining portions of the graphics pipeline 100 to be controlled by the standard application program interface (API) for the purpose of
15 preserving hardware optimizations.

During operation, only one vertex is processed at a time in the functional module 302 that performs the programmable operations. As such, the vertices may be processed independently. Further, the various foregoing operations may be
20 processed for multiple vertices in parallel.

In one embodiment of the present invention, a constant may be received, and the programmable operations may be performed based on the constant. During operation, the constant may be stored in and received from the constant source buffer
25 314. Further, the constant may be accessed in the constant source buffer 314 using an absolute or relative address. As an option, there may be one address register for use during reads from the constant source buffer 314. It may be initialized to 0 at the start of program execution in operation 204 of Figure 2. Further, the constant source buffer 314 may be written with a program which may or may not be exposed to
30 users.

The register 308 may be equipped with single write and triple read access. Register contents may be initialized to (0,0,0,0) at the start of program execution in operation 204 of Figure 2. It should be understood that the output of the functional module 302 may also be stored in the vertex destination buffer 310. The vertex position output may be stored in the vertex destination buffer 310 under a predetermined reserved address. The contents of the vertex destination buffer 310 may be initialized to (0,0,0,1) at the start of program execution in operation 204 of Figure 2.

As an option, the programmable vertex processing may include negating the data, as well as calculating an absolute value. Still yet, the programmable vertex processing may also involve swizzling the data. Data swizzling is useful when generating vectors. Such technique allows the efficient generation of a vector cross product and other vectors.

In one embodiment, the vertex source buffer 312 may be 16 quad-words in size (16*128 bits). Execution of the present invention may be commenced when Param[0]/Position is written. All attributes may be persistent. That is, they remain constant until changed. Table 1 illustrates the framework of the vertex source buffer 312. It should be noted that the number of textures supported may vary across implementations.

Table 1

Program Mode		Standard API	
Param[0]	X,Y,Z,W	Position	X,Y,Z,W
Param[1]	X,Y,Z,W	Skin Weights	W,W,W,W
Param[2]	X,Y,Z,W	Normal	X,Y,Z,*
Param[3]	X,Y,Z,W	Diffuse Color	R,G,B,A
Param[4]	X,Y,Z,W	Specular Color	R,G,B,A

Param[5]	X,Y,Z,W	Fog	F,*,*,*
Param[6]	X,Y,Z,W	Point Size	P,*,*,*
Param[7]	X,Y,Z,W		*,*,*,*
Param[8]	X,Y,Z,W	Texture0	S,T,R,Q
Param[9]	X,Y,Z,W	Texture1	S,T,R,Q
Param[10]	X,Y,Z,W	Texture2	S,T,R,Q
Param[11]	X,Y,Z,W	Texture3	S,T,R,Q
Param[12]	X,Y,Z,W	Texture4	S,T,R,Q
Param[13]	X,Y,Z,W	Texture5	S,T,R,Q
Param[14]	X,Y,Z,W	Texture6	S,T,R,Q
Param[15]	X,Y,Z,W	Texture7	S,T,R,Q

In another embodiment, the vertex destination buffer 310 may be 15 or so quad-words in size and may be deemed complete when the program is finished. The following exemplary vertex destination buffer addresses are pre-defined to fit a standard pipeline. Contents are initialized to (0,0,0,1) at start of program execution in operation 204 of Figure 2. Further, a vector condition code register is initialized as equal to 0.0 at the start of program. Writes to locations that are not used by the downstream hardware may be ignored.

10

A reserved address (HPOS) may be used to denote the homogeneous clip space position of the vertex in the vertex destination buffer 310. It may be generated by the geometry program. Table 2 illustrates the various locations of the vertex destination buffer 310 and a description thereof.

15

Table 2

Location	Description
HPOS	HClip Position x,y,z,w (-1.0 to 1.0)
BCOL0	Back Color0 (diff) r,g,b,a (0.0 to 1.0)

BCOL1	Back Color1 (spec) r,g,b,a (0.0 to 1.0)
COL0	Color0 (diff) r,g,b,a (0.0 to 1.0)
COL1	Color1 (spec) r,g,b,a (0.0 to 1.0)
FOGP	Fog Parameter f,*,*,*
PSIZ	Point Size p,*,*,*
PDIS0	Planar Distance0 d,*,*,*
PDIS1	Planar Distance1 d,*,*,*
PDIS2	Planar Distance2 d,*,*,*
PDIS3	Planar Distance3 d,*,*,*
PDIS4	Planar Distance4 d,*,*,*
PDIS5	Planar Distance5 d,*,*,*
TEX0	Texture0 s,t,r,q
TEX1	Texture1 s,t,r,q
TEX2	Texture2 s,t,r,q
TEX3	Texture3 s,t,r,q
TEX4	Texture4 s,t,r,q
TEX5	Texture5 s,t,r,q
TEX6	Texture6 s,t,r,q
TEX7	Texture7 s,t,r,q

- 5 HPOS - homogeneous clip space position
float[4] x,y,z,w
- standard graphics pipeline process further
(clip check, perspective divide, viewport
scale and bias).
- 10 COL0/BCOL0 - color0 (diffuse)
COL1/BCOL1 - color1 (specular)
float[4] r,g,b,a
- each component gets clamped to (0.0,1.0)
before interpolation
- each component is interpolated at least as
- 15 8-bit unsigned integer.
- 20 TEX0-7 - textures 0 to 7
float[4] s,t,r,q
- each component is interpolated as high
precision float, followed by division of q
and texture lookup. Extra colors could use
texture slots. Advanced fog can be done as a
texture.

5	FOGP	fog parameter float[1] f (distance used in fog equation) - gets interpolated as a high precision float and used in a fog evaluation (linear, exp, exp2) generating a fog color blend value.
	PSIZ	point size float[1] p - gets clamped to (0.0, POINT_SIZE_MAX) and used as point size.
10		
15	PDIS0-5	planar distances float[6] pd0-pd5 used for clipping to 6 arbitrary planes

An exemplary assembly language that may be used in one implementation of the present invention will now be set forth. In one embodiment, no branching instructions may be allowed for maintaining simplicity. It should be noted, however, that branching may be simulated using various combinations of operations. Table 3 illustrates a list of the various resources associated with the programming model 300 of Figure 3. Also shown is a reference format associated with each of the resources along with a proposed size thereof.

25 Table 3

Resources:

30	Vertex Source	- v[*]	of size 16 vectors
	Constant Memory	- c[*]	of size 256 vectors
	Address Register	- A0.x	of size 1 signed integer vector
	Data Registers	- R0-R15	of size 16 vectors
	Condition Codes	- CC	of size 1 vector
	Vertex Destination	- o[*]	of size 17 vectors
35	Instruction Storage		of size 256 instructions

Note: Data Registers, Source, and Constants may be four component floats. The address register may be a vector of 4 signed integers.

For example, the constant source buffer 314 may be accessed as c[*]
5 (absolute) or as c[A0.x+*], c[A0.y+*], c[A0.z+*], c[A0.w+*] (relative). In the
relative case, a 32-bit signed address register may be added to the non-negative read
address. Out of range address reads may result in (0,0,0,0). In one embodiment, the
vertex source buffer 312, vertex destination buffer 310, and register 308 may not
use relative addressing.

10 Vector components may be swizzled before use via four subscripts (xyzw).
Accordingly, an arbitrary component re-mapping may be done. Examples of
swizzling commands are shown in Table 4.

15 Table 4

.xyzw means source(x,y,z,w) → input(x,y,z,w)
.zzxy means source(x,y,z,w) → input(z,z,x,y)
.xxxx means source(x,y,z,w) → input(x,x,x,x)

20 Table 5 illustrates an optional shortcut notation of the assembly language that
may be permitted.

25 Table 5

No subscripts is the same as .xyzw
.x is the same as .xxxx
.y is the same as .yyyy
.z is the same as .zzzz
30 .w is the same as .www

All source operands may be negated by putting a '-' sign in front of the above
notation. Moreover, an absolute value of the source operands may be calculated.

The condition codes (CC) may be changed whenever data is written (by adding a 'c' to the opcode) and shares the writemask with the destination. If there is no other destination, condition codes may be used as a dummy write register.

5

The condition codes are sourced as EQ(equal), NE(not equal), LT(less), GE(greater or equal), LE(less or equal), GT(greater), FL(false), and TR(true), which generates 4-bits of condition code by applying the specified comparison. As a source (for branch and writemask modification), the condition codes may be swizzled.

10

Initially, each component is compared to 0.0 and its status recorded in a condition code status register if the writemask for that component is enabled. Table 5A illustrates various exemplary statuses that may be stored based on the comparison.

15

Table 5A

If (x == 0)
EQ = 1
else
EQ = 0

20

If (x < 0)
LT = 1
else
LT = 0

25

If (x is not a number (NAN))
NAN = 1
else
NAN = 0

30

When data is written, the condition code status register is evaluated based on a user-defined comparison. Table 5B illustrates an exemplary evaluation.

5

Table 5B

if (x <= 0)

10

if (NAN) → False

else if (LT) → True

else if (EQ) → True

else → False

15

Writes to the register 308, vertex destination buffer 310, and the condition codes are maskable. Each component is written only if it appears as a destination subscript (from xyzw). No swizzling is possible for writes and subscripts are ordered (x before y before z before w). It is also possible to modify the write mask by the condition codes (at the beginning of the instruction) by an 'AND' operation in a manner shown in Table 6. It should be noted that the condition codes (sourced as EQ, NE, LT, GE, LE, GT, FL, TR) have swizzle control here.

20

Table 6

25

destination(GT.x)	//writemask[4] = 1111 & GT.xxxx
destination.xw(EQ.yyzz)	//writemask[4] = 1001 & EQ.yyzz

An exemplary assembler format is as follows:

30

OPCODE[c] DESTINATION,SOURCE(S);

Generated data may be written to the register 308, the vertex buffer 310, or the condition codes RC. Output data may be taken from the functional module 302. Table 6A illustrates commands in the proposed assembler format which write output to the register 308 or the vertex destination buffer 310.

5

Table 6A

10 ADDc R4,R1,R2; //result goes into R4, update CC
 ADD o[HPOS],R1,R2; //result goes into the destination buffer
 ADD R4.xy,R1,R2; //result goes into x,y components of R4
 ADDc CC.xy(GT.w),R1,R2; //GT.w ? CC.xy = ADD results compared to
 0.0

15 During operation, the programmable vertex processing is adapted for
carrying out various instructions of an instruction set using any type of programming
language including, but not limited to that set forth hereinabove. Such instructions
may include, but are not limited to a branch operation, a call operation, a return
operation, a cosine operation, a sine operation, a floor operation, a fraction
20 operation, a set-on-equal-to operation, a set false operation, a set-on-greater-than, a
set-on-less-than-or-equal operation, a set-on-not-equal-to operation, a set true
operation, a no operation, address register load, move, multiply, addition, multiply
and addition, reciprocal, reciprocal square root, three component dot product, four
component dot product, distance vector, minimum, maximum, set on less than, set
25 on greater or equal than, exponential base two (2), logarithm base two (2),
exponential, logarithm, and/or light coefficients. Table 7 illustrates the operation
code associated with each of the foregoing instructions. Also indicated is a number
of inputs and outputs as well as whether the inputs and outputs are scalar or vector.

30

Table 7

OPCODE	INPUT(scalar or vector)	OUTPUT(scalar or vector)
--------	-------------------------	--------------------------

As shown in Table 7, each of the instructions includes an input and an output which may take the form of a vector and/or a scalar. It should be noted that such vector and scalar inputs and outputs may be handled in various ways. Further information on dealing with such inputs and outputs may be had by reference to a

5 co-pending application entitled "METHOD, APPARATUS AND ARTICLE OF MANUFACTURE FOR A TRANSFORM MODULE IN A GRAPHICS PROCESSOR" filed December 06, 1999 under serial number 09/456,102 and

attorney docket number NVIDP010/P000127 which is incorporated herein by reference in its entirety.

These various instructions may each be carried out using a unique associated method and data structure. Such data structure includes a source location identifier indicating a source location of data to be processed. Such source location may include a plurality of components. Further provided is a source component identifier indicating in which of the plurality of components of the source location the data resides. The data may be retrieved based on the source location identifier and the source component identifier. This way, the operation associated with the instruction at hand may be performed on the retrieved data in order to generate output.

Also provided is a destination location identifier for indicating a destination location of the output. Such destination location may include a plurality of components. Further, a destination component identifier is included indicating in which of the plurality of components of the destination location the output is to be stored. In operation, the output is stored based on the destination location identifier and the destination component identifier.

Figure 5 is a flowchart illustrating the method 500 in which the foregoing data structure is employed in carrying out the instructions in accordance with one embodiment of the present invention. First, in operation 502, the source location identifier is received indicating a source location of data to be processed. Thereafter, in operation 504, the source component identifier is received indicating in which of the plurality of components of the source location the data resides.

The data is subsequently retrieved based on the source location identifier and the source component identifier, as indicated in operation 506. Further, the particular operation is performed on the retrieved data in order to generate output. See operation 508. The destination location identifier is then identified in operation 510 for indicating a destination location of the output. In operation 512, the

destination component identifier is identified for indicating in which of the plurality of components of the destination location the output is to be stored. Finally, in operation 514, the output is stored based on the destination location identifier and the destination component identifier.

5

As an option, branching among programmable operations may be carried out in the context of the present embodiment. Table 7A illustrates a possible general structure of a vertex program with branching.

10

Table 7A

15

20

25

30

35

```
!!VP2.0
LABEL:          // label table start, only used
for indexed branch
  0:NV_START    // index 0
  2:LBL3        // index 2
  1:LBL_HI     // index 1
CODE:
MAIN:          // entry point
  OpCode
  OpCode
  OpCode
  ...
LBL_HI:        // branch target
  OpCode
LBL1:          // branch target
  OpCode
RET           // end of MAIN
NV_START:     // subroutine
  OpCode
  ...
RET           // end of subroutine
LBL3:         // subroutine
  OpCode
  ...
RET           // end of subroutine
END
```

It should be noted that the program of Table 7A is divided into a number of sections. Table 7B sets forth each of such sections.

Table 7B

- 1. a header of !!VP2.0

2. an optional LABEL (reserved keyword) block containing the labels in the program that the programmer wants indexed. Up to 8 labels can be indexed from 0 to 7
3. a mandatory CODE (reserved keyword) block
- 5 4. a mandatory MAIN (reserved keyword) entry point (must be in CODE block)
5. a mandatory END (reserved keyword)

10 It should be understood that branches/calls/returns are conditional, based on the condition code register. Moreover, branches/calls may be done to any label or to the index stored in an address register. In one embodiment, only a certain number (i.e. 16) of indexes may exist. Trying to access an uninitialized index may terminate the program.

15 As an option, there may be an address stack for use by subroutine call/return. Such address stack may be of depth four (4). In such embodiment, a call attempting to push a fifth (5th) return address may terminate the program. Further, a return attempting to pop an empty address stack will terminate the program.

20 To prevent the hardware from hanging, any program may be terminated after executing a certain number of instructions (i.e. 65536th instruction). If a program is prematurely terminated, the current state of the output buffer may be the final program output.

25 Further information will now be set forth regarding each of the instructions set forth in Table 7. In particular, an exemplary format, description, operation, and examples are provided using the programming language set forth earlier.

Address Register Load (ARL)

30

Format:

ARL A0[.xyzw][(CC[.xyzw]),[-]S0[.xyzw]

Description:

- 5 The contents of source scalar are moved into a specified address register.
Source may have one subscript. Destination may have an “.xyz” subscript. In one
embodiment, the only valid address register may be designated as “A0.x.” The
address register “A0.x” may be used as a base address for constant reads. The
source may be a float that is truncated towards negative infinity into a signed integer.
10 In one embodiment, ARL cannot modify the condition codes.

Operation:

- 15 Table 8A sets forth an example of operation associated with the ARL
instruction.

Table 8A

20 t.x = source0.c***; /* c is x or y or z or w */
 t.y = source0.*c**;
 t.z = source0.**c*;
 t.w = source0.***c;
 if (-source0)
 t = -t;
25 q.x = floor(t.x);
 q.y = floor(t.y);
 q.z = floor(t.z);
 q.w = floor(t.w);
30 if (destination.x) A0.x = q.x;
 if (destination.y) A0.y = q.y;
 if (destination.z) A0.z = q.z;
 if (destination.w) A0.w = q.w;
35

Examples:

ARL A0.x,v[7].w (move vertex scalar into address register 0)

MOV R6,c[A0.x+7] (move constant at address A0.x+7 into register R6)

Branch,Call,Return (BRA,CAL,RET)

Format:

5
BRA CC[.xyzw],Label
BRA CC[.xyzw],A0.[xyzw]+Imm

CAL CC[.xyzw],Label
10 CAL CC[.xyzw],A0.[xyzw]+Imm

RET CC[.xyzw]

Description:

15
Conditional branch, subroutine call, and subroutine return are set forth herein. Condition is based on the condition code bits ORed together after a swizzle operation. A taken CAL pushes the return address only onto a stack. A taken RET pops the return address off this stack. The address register may be a scalar and the
20 immediate constant between 0-255 is added to it, the sum clamped to 0-7 and then used as the index of the label to branch to. Branch/Call/Return cannot modify CC. The default branch condition is TR.

Operation:

25
Table 8B sets forth an example of operation associated with the BRA, CAL, RET instruction.

Table 8B

30
b.x = RC.c***; /* c is x or y or z or w */
b.y = RC.*c**;

```

b.z = RC.**c*;
b.w = RC.**c*;

5      f.x = Evaluate(Condition,b.x);
      f.y = Evaluate(Condition,b.y);
      f.z = Evaluate(Condition,b.z);
      f.w = Evaluate(Condition,b.w);

10     if (f.x | f.y | f.z | f.w)
        branch/call/return;

```

Examples:

```

      BRA GT.x,Label_0; // Branch to Label_0 if CC.x is > 0.0
15     CAL TR,A0.z+2;    // Call to jumtable[A0.z+2]
      RET LE.xxzz;      // Return from CAL if CC.x or CC.z is <= 0.0

```

Cosine (COS)

20 Format:

COS[c] D[.xyzw][(CC[.xyzw])],[-]S0.[xyzw]

Description:

25

A cosine function is provided. The source should be a scalar. Input may be an unbounded angle in radians.

Operation:

30

Table 8C sets forth an example of operation associated with the COS instruction.

Table 8C

35

```

t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
t.w = source0.***c;

```

```

        if (-source0)
            t = -t;

        q.x = q.y = q.z = q.w = COS(t.x);    where
5      |ieee_cos(t.x)-COS(t.x)| < 1/(2**22) for 0.0 <= t.x <
        2PI

        if (destination.x) R.x = q.x;
        if (destination.y) R.y = q.y;
10     if (destination.z) R.z = q.z;
        if (destination.w) R.w = q.w;

```

Examples:

15 COS R0,R3.w;

Exponential Base 2 (EX2)

Format:

20 EX2[c] D[.xyzw][(CC[.xyzw])],[-]S0.[xyzw]

Description:

25 Provided is an exponential base2 instruction that accepts a scalar source0.

EX2(-Inf) or underflow gives (0.0,0.0,0.0,0.0)

EX2(+Inf) or overflow gives (+Inf,+Inf,+Inf,+Inf)

30 Operation:

Table 8D sets forth an example of operation associated with the EX2 instruction.

35 Table 8D

```

t.x = source0.c***;    /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;

```

```

t.w = source0.***c;
if (-source0)
    t = -t;

5      tmpA = FLR(t.x);
      tmpB = FRC(t.x);
      /* 0.0 <= tmpB < 1.0 */

10     q.x = q.y = q.z = q.w = 2^(tmpA) * 2^(tmpB);
      where |ieee_exp(tmpB*LN2) - EX2(tmpB)| < 1/(2**22)

      if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
      if (destination.z) R.z = q.z;
15     if (destination.w) R.w = q.w;

```

Examples:

```

EX2 R4,R3.z;

20

```

Floor (FLR)

Format:

```

25      FLR[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw]

```

Description:

The present instruction sets the destination to the floor of the source.

30

Operation:

Table 8E sets forth an example of operation associated with the FLR instruction.

35

Table 8E

```

t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
40  t.z = source0.**c*;
      t.w = source0.***c;

```

```

    if (-source0)
        t = -t;

5      q.x = floor(t.x);
      q.y = floor(t.y);
      q.z = floor(t.z);
      q.w = floor(t.w);

10     if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
      if (destination.z) R.z = q.z;
      if (destination.w) R.w = q.w;
```

Examples:

```

15      FLR R4.z,R3;      // R4.z = floor(R3.z)
```

Fraction (FRC)

Format:

FRC[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw]

Description:

25 The present description set the destination to a fractional part of the source.
The fraction is $0.0 \leq \text{fraction} < 1.0$.

Operation:

30 Table 8F sets forth an example of operation associated with the FRC
instruction.

Table 8F

```

35      t.x = source0.c***;    /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;
      t.w = source0.***c;
40      if (-source0)
          t = -t;

      q.x = t.x - floor(t.x);
      q.y = t.y - floor(t.y);
45      q.z = t.z - floor(t.z);
      q.w = t.w - floor(t.w);

      if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
50      if (destination.z) R.z = q.z;
      if (destination.w) R.w = q.w;
```

Examples:

```
FRC R4.z,R3; // R4.z = R3.z - floor(R3.z)
```

5 **Logarithm Base 2 (LG2)**

Format:

```
LG2[c] D[.xyzw][(CC[.xyzw])],[-]S0.[xyzw]
```

10

Description:

Logarithm base2 accepts a scalar source0 of which the sign bit is ignored.

15

```
LG2(0.0) gives (-Inf,-Inf,-Inf,-Inf)
LG2(Inf) gives (+Inf,+Inf,+Inf,+Inf)
```

Operation:

20

Table 8G sets forth an example of operation associated with the LG2 instruction.

Table 8G

25

```
t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
```

30

```
t.z = source0.**c*;
t.w = source0.***c;
if (-source0)
    t = -t;
```

35

```
tmpA = exponent(t.x); /* -
128 <= tmpA < 128 */
tmpB = mantissa(t.x); /* 1.0
<= tmpB < 2.0 */
```

40

```
q.x = q.y = q.z = q.w = tmpA + log2(tmpB); where
|ieee_log(tmpB)/LN2-LG2(tmpB)| < 1/(2**22)

if (destination.x) R.x = q.x;
if (destination.y) R.y = q.y;
if (destination.z) R.z = q.z;
if (destination.w) R.w = q.w;
```

45

Examples:

```
LG2 R4,R3.z;
```

Mov (MOV)

Format:

MOV[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw]

5

Description:

The contents of a designated source are moved into a destination.

10 Operation:

Table 8H sets forth an example of operation associated with the MOV instruction.

15 Table 8H

```

t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
20 t.w = source0.***c;
   if (-source0)
       t = -t;

q.x = t.x;
25 q.y = t.y;
   q.z = t.z;
   q.w = t.w;

30 if (destination.x) (register ? R.x : o[OADD].x) = q.x;
   if (destination.y) (register ? R.y : o[OADD].y) = q.y;
   if (destination.z) (register ? R.z : o[OADD].z) = q.z;
   if (destination.w) (register ? R.w : o[OADD].w) = q.w;
```

35 Examples:

MOV o[1],-R4 (move negative R4 into o[1])

MOV R5,v[POS].w (move w component of v[POS] into xyzw components of R5)

MOV o[HPOS],c[0] (output constant in location zero)

MOV R7.xyw,R4.x (move x component of R4 into x,y,w components of R7)

5 Multiply (MUL)

Format:

MUL[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

The present instruction multiplies sources into a destination. It should be noted that 0.0 times anything is 0.0.

Operation:

Table 8I sets forth an example of operation associated with the MUL instruction.

Table 8I

```
t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
t.w = source0.***c;
if (-source0)
    t = -t;

u.x = source1.c***; /* c is x or y or z or w */
u.y = source1.*c**;
u.z = source1.**c*;
u.w = source1.***c;
if (-source1)
    u = -u;

q.x = t.x*u.x;
q.y = t.y*u.y;
q.z = t.z*u.z;
q.w = t.w*u.w;
```

```

5      if (destination.x) (register ? R.x : o[OADD].x) = q.x;
      if (destination.y) {register ? R.y : o[OADD].y} = q.y;
      if (destination.z) (register ? R.z : o[OADD].z) = q.z;
      if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

Examples:

```

      MUL R6,R5,c[CON5] R6.xyzw = R5.xyzw * c[CON5].xyzw
10      MUL R6.x,R5.w,-R7 R6.x = R5.w*-R7.x

```

Add (ADD)

Format:

```

15      ADD[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

```

Description:

```

20      The present instruction adds sources into a destination.

```

Operation:

```

25      Table 8J sets forth an example of operation associated with the ADD
      instruction.

```

Table 8J

```

30      t.x = source0.c***; /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;
      t.w = source0.***c;
      if (-source0)
35          t = -t;

      u.x = source1.c***; /* c is x or y or z or w */
      u.y = source1.*c**;
      u.z = source1.**c*;

```

```
u.w = source1.***c;
if (-source1)
    u = -u;

5      q.x = t.x+u.x;
      q.y = t.y+u.y;
      q.z = t.z+u.z;
      q.w = t.w+u.w;

10     if (destination.x) (register ? R.x : o[OADD].x) = q.x;
      if (destination.y) {register ? R.y : o[OADD].y} = q.y;
      if (destination.z) (register ? R.z : o[OADD].z) = q.z;
      if (destination.w) (register ? R.w : o[OADD].w) = q.w;
```

15

Examples:

```
ADD R6,R5.x,c[CON5] R6.xyzw = R5.x + c[CON5].xyzw
ADD R6.x,R5,-R7    R6.x = R5.x - R7.x

20  ADD R6,-R5,c[CON5] R6.xyzw = -R5.xyzw + c[CON5].xyzw
```

Multiply And Add (MAD)

25 Format:

```
MAD[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw],
      [-]S2[.xyzw]
```

30 Description:

The present instruction multiplies and adds sources into a destination. It should be noted that 0.0 times anything is 0.0.

35 Operation:

Table 8K sets forth an example of operation associated with the MAD instruction.

Table 8K

```

5
    t.x = source0.c***; /* c is x or y or z or w */
    t.y = source0.*c**;
    t.z = source0.**c*;
    t.w = source0.***c;
10    if (-source0)
        t = -t;

    u.x = source1.c***; /* c is x or y or z or w */
    u.y = source1.*c**;
15    u.z = source1.**c*;
    u.w = source1.***c;
    if (-source1)
        u = -u;

20    v.x = source2.c***; /* c is x or y or z or w */
    v.y = source2.*c**;
    v.z = source2.**c*;
    v.w = source2.***c;
25    if (-source2)
        v = -v;

    q.x = t.x*u.x+v.x;
    q.y = t.y*u.y+v.y;
    q.z = t.z*u.z+v.z;
30    q.w = t.w*u.w+v.w;

    if (destination.x) (register ? R.x : o[OADD].x) = q.x;
    if (destination.y) {register ? R.y : o[OADD].y} = q.y;
    if (destination.z) (register ? R.z : o[OADD].z) = q.z;
35    if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

40 Examples:

MAD R6,-R5,v[POS],-R3 R6 = -R5 * v[POS] - R3

MAD R6.z,R5.w,v[POS],R5 R6.z = R5.w * v[POS].z + R5.z

45 **Reciprocal (RCP)**

Format:

RCP[c] D[.xyzw][(CC[.xyzw])],[-]S0.[xyzw]

Description:

- 5 The present instruction inverts a source scalar into a destination. The source may have one subscript. Output may be exactly 1.0 if the input is exactly 1.0.

RCP(-Inf) gives (-0.0,-0.0,-0.0,-0.0)

RCP(-0.0) gives (-Inf,-Inf,-Inf,-Inf)

- 10 RCP(+0.0) gives (+Inf,+Inf,+Inf,+Inf)

RCP(+Inf) gives (0.0,0.0,0.0,0.0)

Operation:

- 15 Table 8L sets forth an example of operation associated with the RCP instruction.

Table 8L

```

20           t.x = source0.c***;     /* c is x or y or z or w */
             t.y = source0.*c**;
             t.z = source0.**c*;
             t.w = source0.***c;
25           if (-source0)
              t = -t;

             if (t.x == 1.0)
              q.x = q.y = q.z = q.w = 1.0;
             else
30            q.x = q.y = q.z = q.w = 1.0/t.x;     where |q.x -
              IEEE(1.0/t.x)| < 1/(2**22) for all 1.0<=t.x<2.0

             if (destination.x) (register ? R.x : o[OADD].x) = q.x;
             if (destination.y) {register ? R.y : o[OADD].y} = q.y;
35           if (destination.z) (register ? R.z : o[OADD].z) = q.z;
             if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

Examples:

RCP R2,c[A0.x+14].x R2.xyzw = 1/c[A0.x+14].x

RCP R2.w,R3.z R2.w = 1/R3.z

Reciprocal Square Root (RSQ)

5

Format:

RSQ[c] D[.xyzw][(CC[.xyzw])],[-]S0.[xyzw]

10 Description:

The present instruction performs an inverse square root of absolute value on a source scalar into a destination. The source may have one subscript. The output may be exactly 1.0 if the input is exactly 1.0.

15

RSQ(0.0) gives (+Inf,+Inf,+Inf,+Inf)

RSQ(Inf) gives (0.0,0.0,0.0,0.0)

Operation:

20

Table 8M sets forth an example of operation associated with the RSQ instruction.

Table 8M

25

```
t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
```

30

```
t.z = source0.**c*;
t.w = source0.***c;
if (-source0)
    t = -t;

if (t.x == 1.0)
    q.x = q.y = q.z = q.w = 1.0;
else
```

35

q.x=q.y=q.z=q.w=1.0/sqrt(abs(t.x)); with |q.x -
IEEE(1.0/sqrt(t.x))| < 1/(2**22) for 1.0<=t.x<4.0

5 if (destination.x) (register ? R.x : o[OADD].x) = q.x;
if (destination.y) {register ? R.y : o[OADD].y} = q.y;
if (destination.z) (register ? R.z : o[OADD].z) = q.z;
if (destination.w) (register ? R.w : o[OADD].w) = q.w;

Examples:

10

RSQ o[PA0],R3.y o[PA0] = 1/sqrt(abs(R3.y))

RSQ R2.w,v[9].x R2.w = 1/sqrt(abs(v[9].x))

Set On Equal To (SEQ)

15

Format:

SEQ[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

20

Description:

The present instruction set a destination to 1.0/0.0 if source0 is
equal/not_equal compared to source1.

25

Operation:

Table 8N sets forth an example of operation associated with the SEQ
instruction.

30

Table 8N

35 t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
t.w = source0.***c;
if (-source0)
t = -t;

```

5      u.x = source1.c***; /* c is x or y or z or w */
      u.y = source1.*c**;
      u.z = source1.**c*;
      u.w = source1.***c;
      if (-source1)
          u = -u;

10     q.x = (t.x == u.x) ? 1.0 : 0.0;
      q.y = (t.y == u.y) ? 1.0 : 0.0;
      q.z = (t.z == u.z) ? 1.0 : 0.0;
      q.w = (t.w == u.w) ? 1.0 : 0.0;

15     if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
      if (destination.z) R.z = q.z;
      if (destination.w) R.w = q.w;

```

Examples:

```

20     SEQ R4,R3,R7; // R4.xyzw = (R3.xyzw == R7.xyzw ? 1.0 : 0.0)

```

Set False (SFL)

25 Format:

SFL[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

30 The present instruction set the destination to 0.0.

Operation:

35 Table 80 sets forth an example of operation associated with the SFL instruction.

Table 80

```

40     t.x = source0.c***; /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;

```

```

t.w = source0.***c;
if (-source0)
    t = -t;

5      u.x = source1.c***;    /* c is x or y or z or w */
      u.y = source1.*c**;
      u.z = source1.**c*;
      u.w = source1.***c;
10     if (-source1)
        u = -u;

      q.x = 0.0;
      q.y = 0.0;
15     q.z = 0.0;
      q.w = 0.0;

      if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
20     if (destination.z) R.z = q.z;
      if (destination.w) R.w = q.w;

```

Examples:

```

SFL R4,R3,R7;    // R4.xyzw = 0.0,0.0,0.0,0.0
25

```

Set On Greater Than (SGT)

Format:

```

30      SGT[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

```

Description:

The present instruction sets the destination to 1.0/0.0 if source0 is
35 greater/less_or_equal compared to source1.

Operation:

Table 8P sets forth an example of operation associated with the SGT
40 instruction.

Table 8P

```

5      t.x = source0.c***; /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;
      t.w = source0.***c;
      if (-source0)
          t = -t;

10     u.x = source1.c***; /* c is x or y or z or w */
      u.y = source1.*c**;
      u.z = source1.**c*;
      u.w = source1.***c;
      if (-source1)
          u = -u;

15

      q.x = (t.x > u.x) ? 1.0 : 0.0;
      q.y = (t.y > u.y) ? 1.0 : 0.0;
      q.z = (t.z > u.z) ? 1.0 : 0.0;
      q.w = (t.w > u.w) ? 1.0 : 0.0;

20

      if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
      if (destination.z) R.z = q.z;
      if (destination.w) R.w = q.w;

25

```

Examples:

```

30     SGT R4,R3,R7; // R4.xyzw = (R3.xyzw > R7.xyzw ? 1.0 : 0.0)

```

Sine (SIN)

Format:

```

35     SIN[c] D[.xyzw][(CC[.xyzw])],[-]S0.[xyzw]

```

Description:

40 The present instruction is a sine function. The source is a scalar. Input is an unbounded angle in radians.

Operation:

Table 8Q sets forth an example of operation associated with the SIN instruction.

Table 8Q

```

5      t.x = source0.c***;    /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;
      t.w = source0.***c;
10     if (-source0)
        t = -t;

      q.x = q.y = q.z = q.w = SIN(t.x);    where
      |ieee_sin(t.x)-SIN(t.x)| < 1/(2**22) for 0.0 <= t.x <
15     2PI

      if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
      if (destination.z) R.z = q.z;
20     if (destination.w) R.w = q.w;

```

Examples:

SIN R0,R3.x;

25

Set On Less Than Or Equal (SLE)

Format:

30 SLE[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

The present instruction sets the destination to 1.0/0.0 if source0 is
35 less_or_equal/greater compared to source1.

Operation:

Table 8S sets forth an example of operation associated with the SLE instruction.

Table 8S

5
t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
t.w = source0.***c;
10 if (-source0)
t = -t;

u.x = source1.c***; /* c is x or y or z or w */
u.y = source1.*c**;
15 u.z = source1.**c*;
u.w = source1.***c;
if (-source1)
u = -u;

20 q.x = (t.x <= u.x) ? 1.0 : 0.0;
q.y = (t.y <= u.y) ? 1.0 : 0.0;
q.z = (t.z <= u.z) ? 1.0 : 0.0;
q.w = (t.w <= u.w) ? 1.0 : 0.0;

25 if (destination.x) R.x = q.x;
if (destination.y) R.y = q.y;
if (destination.z) R.z = q.z;
if (destination.w) R.w = q.w;

30 Examples:

SLE R4,R3,R7; // R4.xyzw = (R3.xyzw <= R7.xyzw ? 1.0 : 0.0)

Three Component Dot Product (DP3)

35

Format:

DP3[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

40 Description:

The present instruction performs a three component dot product of the sources into a destination. It should be noted that 0.0 times anything is 0.0.

Operation:

5 Table 8T sets forth an example of operation associated with the DP3 instruction.

Table 8T

10 t.x = source0.c***; /* c is x or y or z or w */
 t.y = source0.*c**;
 t.z = source0.**c*;
 t.w = source0.***c;
 if (-source0)
 t = -t;
 15 u.x = source1.c***; /* c is x or y or z or w */
 u.y = source1.*c**;
 u.z = source1.**c*;
 u.w = source1.***c;
 20 if (-source1)
 u = -u;
 q.x = q.y = q.z = q.w = t.x*u.x + t.y*u.y + t.z*u.z;
 25 if (destination.x) (register ? R.x : o[OADD].x) = q.x;
 if (destination.y) {register ? R.y : o[OADD].y} = q.y;
 if (destination.z) (register ? R.z : o[OADD].z) = q.z;
 if (destination.w) (register ? R.w : o[OADD].w) = q.w;

30 Examples:

DP3 R6,R3,R4 R6.xyzw = R3.x*R4.x + R3.y*R4.y + R3.z*R4.z

DP3 R6.w,R3,R4 R6.w = R3.x*R4.x + R3.y*R4.y + R3.z*R4.z

35 **Four Component Dot Product (DP4)**

Format:

DP4[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

40

Description:

The present instruction performs a four component dot product of the sources into a destination. It should be noted that 0.0 times anything is 0.0.

5 Operation:

Table 8U sets forth an example of operation associated with the DP4 instruction.

10

Table 8U

15

20

25

30

```
t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
t.w = source0.***c;
if (-source0)
    t = -t;

u.x = source1.c***; /* c is x or y or z or w */
u.y = source1.*c**;
u.z = source1.**c*;
u.w = source1.***c;
if (-source1)
    u = -u;

q.x = q.y = q.z = q.w = t.x*u.x + t.y*u.y + t.z*u.z +
t.w*u.w;

if (destination.x) (register ? R.x : o[OADD].x) = q.x;
if (destination.y) (register ? R.y : o[OADD].y) = q.y;
if (destination.z) (register ? R.z : o[OADD].z) = q.z;
if (destination.w) (register ? R.w : o[OADD].w) = q.w;
```

35 Examples:

DP4 R6,v[POS],c[MV0] R6.xyzw = v.x*c.x + v.y*c.y + v.z*c.z +
v.w*c.w

DP4 R6.xw,v[POS].w,R3 R6.xw = v.w*R3.x + v.w*R3.y + v.w*R3.z +
v.w*R3.w

5

Distance Vector (DST)

Format:

10 DST[c] D[.xyzw][[(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

15 The present instruction calculates a distance vector. A first source vector is
assumed to be (NA,d*d,d*d,NA) and a second source vector is assumed to be
(NA,1/d,NA,1/d). A destination vector is then outputted in the form of
(1,d,d*d,1/d). It should be noted that 0.0 times anything is 0.0.

Operation:

20

Table 8V sets forth an example of operation associated with the DST
instruction.

Table 8V

25

```
t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
```

30

```
t.z = source0.**c*;
t.w = source0.***c;
if (-source0)
    t = -t;
```

35

```
u.x = source1.c***; /* c is x or y or z or w */
u.y = source1.*c**;
```

```
u.z = source1.**c*;
u.w = source1.***c;
if (-source1)
```

```

        u = -u;

        q.x = 1.0;
        q.y = t.y*u.y;
5       q.z = t.z;
        q.w = u.w;

        if (destination.x) (register ? R.x : o[OADD].x) = q.x;
        if (destination.y) {register ? R.y : o[OADD].y} = q.y;
10      if (destination.z) (register ? R.z : o[OADD].z) = q.z;
        if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

Examples:

```

15      DST R2,R3,R4      R2.xyzw = (1.0,R3.y*R4.y,R3.z,R4.w)

```

Minimum (MIN)

Format:

```

20      MIN[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

```

Description:

25 The present instruction determines a minimum of sources, and moves the same into a destination.

Operation:

30 Table 8W sets forth an example of operation associated with the MIN instruction.

Table 8W

```

35      t.x = source0.c***; /* c is x or y or z or w */
        t.y = source0.*c**;
        t.z = source0.**c*;
        t.w = source0.***c;
        if (-source0)

```

```

t = -t;

u.x = source1.c***; /* c is x or y or z or w */
u.y = source1.*c**;
5 u.z = source1.**c*;
u.w = source1.***c;
if (-source1)
    u = -u;

10 q.x = (t.x < u.x) ? t.x : u.x;
q.y = (t.y < u.y) ? t.y : u.y;
q.z = (t.z < u.z) ? t.z : u.z;
q.w = (t.w < u.w) ? t.w : u.w;

15 if (destination.x) (register ? R.x : o[OADD].x) = q.x;
if (destination.y) {register ? R.y : o[OADD].y} = q.y;
if (destination.z) (register ? R.z : o[OADD].z) = q.z;
if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

Examples:

MIN R2,R3,R4 R2 = component min(R3,R4)

MIN R2.x,R3.z,R4 R2.x = min(R3.z,R4.x)

Maximum (MAX)

Format:

30 MAX[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

35 The present instruction determines a maximum of sources, and moves the same into a destination.

Operation:

40 Table 8X sets forth an example of operation associated with the MAX instruction.

Table 8X

```

5      t.x = source0.c***;    /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;
      t.w = source0.***c;
      if (-source0)
10         t = -t;

      u.x = source1.c***;    /* c is x or y or z or w */
      u.y = source1.*c**;
      u.z = source1.**c*;
      u.w = source1.***c;
15      if (-source1)
         u = -u;

      q.x = (t.x >= u.x) ? t.x : u.x;
      q.y = (t.y >= u.y) ? t.y : u.y;
20      q.z = (t.z >= u.z) ? t.z : u.z;
      q.w = (t.w >= u.w) ? t.w : u.w;

      if (destination.x) (register ? R.x : o[OADD].x) = q.x;
      if (destination.y) (register ? R.y : o[OADD].y) = q.y;
25      if (destination.z) (register ? R.z : o[OADD].z) = q.z;
      if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

Examples:

```

30      MAX R2,R3,R4      R2 = component max(R3,R4)
      MAX R2.w,R3.x,R4    R2.w = max(R3.x,R4.w)

```

Set On Less Than (SLT)

35 Format:

SLT[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

40

The present instruction sets a destination to 1.0/0.0 if source0 is less_than/greater_or_equal to source1. The following relationships should be noted:

SetEQ R0,R1 = (SGE R0,R1) * (SGE -R0,-R1)

SetNE R0,R1 = (SLT R0,R1) + (SLT -R0,-R1)

SetLE R0,R1 = SGE -R0,-R1

5 SetGT R0,R1 = SLT -R0,-R1

Operation:

10 Table 8Y sets forth an example of operation associated with the SLT instruction.

Table 8Y

15 t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
t.w = source0.***c;
20 if (-source0)
t = -t;

u.x = source1.c***; /* c is x or y or z or w */
u.y = source1.*c**;
25 u.z = source1.**c*;
u.w = source1.***c;
if (-source1)
u = -u;

30 q.x = (t.x < u.x) ? 1.0 : 0.0;
q.y = (t.y < u.y) ? 1.0 : 0.0;
q.z = (t.z < u.z) ? 1.0 : 0.0;
q.w = (t.w < u.w) ? 1.0 : 0.0;

35 if (destination.x) R.x = q.x;
if (destination.y) R.y = q.y;
if (destination.z) R.z = q.z;
if (destination.w) R.w = q.w;

40

Examples:

SLT R4,R3,R7 R4.xyzw = (R3.xyzw < R7.xyzw ? 1.0 : 0.0)

SLT R3.xz,R6.w,R4 R3.xz = (R6.w < R4.xyzw ? 1.0 : 0.0)

Set On Greater Or Equal Than (SGE)

Format:

5

SGE[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

10

The present instruction set a destination to 1.0/0.0 if source0 is greater_or_equal/less_than source1.

Operation:

15

Table 8Z sets forth an example of operation associated with the SGE instruction.

Table 8Z

20

```
t.x = source0.c***; /* c is x or y or z or w */
t.y = source0.*c**;
t.z = source0.**c*;
t.w = source0.***c;
if (-source0)
```

25

```
    t = -t;
```

30

```
u.x = source1.c***; /* c is x or y or z or w */
u.y = source1.*c**;
u.z = source1.**c*;

if (-source1)
    u = -u;
```

35

```
q.x = (t.x >= u.x) ? 1.0 : 0.0;
q.y = (t.y >= u.y) ? 1.0 : 0.0;
q.z = (t.z >= u.z) ? 1.0 : 0.0;
q.w = (t.w >= u.w) ? 1.0 : 0.0;
```

40

```
if (destination.x) R.x = q.x;
if (destination.y) R.y = q.y;
if (destination.z) R.z = q.z;
if (destination.w) R.w = q.w;
```

Examples:

SGE R4,R3,R7 R4.xyzw = (R3.xyzw >= R7.xyzw ? 1.0 : 0.0)
5 SGE R3.xz,R6.w,R4 R3.xz = (R6.w >= R4.xyzw ? 1.0 : 0.0)

Exponential Base 2 (EXP)

Format:

10

EXP[c] D[.xyzw][(CC[.xyzw])],[-]S0.[xyzw]

Description:

15

The present instruction performs an exponential base 2 partial support. It generates an approximate answer in dest.z, and allows for a more accurate answer of dest.x*FUNC(dest.y) where FUNC is some user approximation to 2**dest.y (0.0 <= dest.y < 1.0). It also accepts a scalar source0. It should be noted that reduced precision arithmetic is acceptable in evaluating dest.z.

20

EXP(-Inf) or underflow gives (0.0,0.0,0.0,1.0)
EXP(+Inf) or overflow gives (+Inf,0.0,+Inf,1.0)

Operation:

25

Table 8AA sets forth an example of operation associated with the EXP instruction.

Table 8AA

30

t.x = source0.c***; /* c is x or y or z or w */

```

t.y = source0.*c**;  

t.z = source0.**c*;  

t.w = source0.***c;  

5  if (-source0)  

    t = -t;  

  

q.x = 2**TruncateTo-Infinity(t.x);  

q.y = t.x - TruncateTo-Infinity(t.x);  

q.z = q.x * APPX(q.y);           where  

10 |ieee_exp(q.y*LN2)-APPX(q.y)| < 1/(2**11) for all  

    0<=q.y<1.0  

    q.w = 1.0;  

  

15 if (destination.x) (register ? R.x : o[OADD].x) = q.x;  

    if (destination.y) {register ? R.y : o[OADD].y} = q.y;  

    if (destination.z) (register ? R.z : o[OADD].z) = q.z;  

    if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

Examples:

20

EXP R4,R3.z

Logarithm Base 2 (LOG)

25

Format:

LOG[c] D[.xyzw][((CC[.xyzw])),[-]S0.[xyzw]

Description:

30

The present instruction performs a logarithm base 2 partial support. It generates an approximate answer in dest.z and allows for a more accurate answer of dest.x+FUNC(dest.y) where FUNC is some user approximation of log2(dest.y) (1.0 <= dest.y < 2.0). It also accepts a scalar source0 of which the sign bit is ignored.

35 Reduced precision arithmetic is acceptable in evaluating dest.z.

LOG(0.0) gives (-Inf,1.0,-Inf,1.0)

LOG(Inf) gives (Inf,1.0,Inf,1.0)

Operation:

Table 8BB sets forth an example of operation associated with the LOG instruction.

5

Table 8BB

10

```
t.x = source0.c***; /* c is x or y or z or w */

else {
    q.x = -inf; q.y = 1.0; q.z = -inf; q.w = 1.0;
}
```

30

```
if (destination.x) (register ? R.x : o[OADD].x) = q.x;
if (destination.y) (register ? R.y : o[OADD].y) = q.y;
if (destination.z) (register ? R.z : o[OADD].z) = q.z;
if (destination.w) (register ? R.w : o[OADD].w) = q.w;
```

Examples:

35

LOG R4,R3.z

Light Coefficients (LIT)

Format:

40

LIT[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw]

Description:

The present instruction provides lighting partial support. It calculates lighting coefficients from two dot products and a power (which gets clamped to $-128.0 < \text{power} < 128.0$). The source vector is:

5

Source0.x = n*1 (unit normal and light vectors)

Source0.y = n*h (unit normal and halfangle vectors)

Source0.z is unused

Source0.w = power

10

Reduced precision arithmetic is acceptable in evaluating dest.z. Allowed error is equivalent to a power function combining the LOG and EXP instructions ($\text{EXP}(\text{w} * \text{LOG}(\text{y}))$). An implementation may support at least 8 fraction bits in the power. Note that since 0.0 times anything may be 0.0, taking any base to the power of 0.0 will yield 1.0.

15

Operation:

Table 8CC sets forth an example of operation associated with the LIT instruction.

20

Table 8CC

```
25      t.x = source0.c***;    /* c is x or y or z or w */
      t.y = source0.*c**;  
      t.z = source0.**c*;  
      t.w = source0.***c;  
      if (-source0)  
30          t = -t;  
  
      if (t.w < -127.9961)      t.w = -127.9961;    /* assuming  
      power is s8.8 */  
      else if (t.w > 127.9961) t.w = 127.9961;  
      if (t.x < 0.0) t.x = 0.0;  
35      if (t.y < 0.0) t.y = 0.0;  
  
      q.x = 1.0;  
      /* ambient */
```

```

q.y = t.x;
/* diffuse */
q.z = (t.x > 0.0 ? EXP(t.w*LOG(t.y)) : 0.0);
/* specular */
5   q.w = 1.0;

if (destination.x) (register ? R.x : o[OADD].x) = q.x;
if (destination.y) {register ? R.y : o[OADD].y} = q.y;
if (destination.z) (register ? R.z : o[OADD].z) = q.z;
10  if (destination.w) (register ? R.w : o[OADD].w) = q.w;

```

Set On Not Equal To (SNE)

Format:

20 SNE[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

Description:

25 The present instruction sets the destination to 1.0/0.0 if source0 is
not_equal/equal compared to source1.

Operation:

30 Table 8DD sets forth an example of operation associated with the SNE
instruction.

Table 8DD

```

35   t.x = source0.c***;   /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;
      t.w = source0.***c;
      if (-source0)
40     t = -t;

```

```

5      u.x = source1.c***;    /* c is x or y or z or w */
      u.y = source1.*c**;
      u.z = source1.**c*;
      u.w = source1.***c;
      if (-source1)
          u = -u;

10     q.x = (t.x != u.x) ? 1.0 : 0.0;
      q.y = (t.y != u.y) ? 1.0 : 0.0;
      q.z = (t.z != u.z) ? 1.0 : 0.0;
      q.w = (t.w != u.w) ? 1.0 : 0.0;

15     if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
      if (destination.z) R.z = q.z;
      if (destination.w) R.w = q.w;

```

Examples:

```

20     SNE R4,R3,R7;    // R4.xyzw = (R3.xyzw != R7.xyzw ? 1.0 : 0.0)

```

Set True (STR)

Format:

```

25     STR[c] D[.xyzw][(CC[.xyzw])],[-]S0[.xyzw],[-]S1[.xyzw]

```

Description:

```

30     The present instruction sets the destination to 1.0.

```

Operation:

```

35     Table 8EE sets forth an example of operation associated with the STR
      instruction.

```

Table 8EE

```

40     t.x = source0.c***;    /* c is x or y or z or w */
      t.y = source0.*c**;
      t.z = source0.**c*;

```

```

t.w = source0.***c;
if (-source0)
    t = -t;

5      u.x = source1.c***; /* c is x or y or z or w */
      u.y = source1.*c**;
      u.z = source1.**c*;
      u.w = source1.***c;
10     if (-source1)
        u = -u;

      q.x = 1.0;
      q.y = 1.0;
      q.z = 1.0;
15     q.w = 1.0;

      if (destination.x) R.x = q.x;
      if (destination.y) R.y = q.y;
      if (destination.z) R.z = q.z;
20     if (destination.w) R.w = q.w;

```

Examples:

```

25     STR R4,R3,R7; // R4.xyzw = 1.0,1.0,1.0,1.0

```

Floating Point Requirements

All calculations may be assumed to be IEEE single precision floating point
 with a format of s1e8m23, and an exponent bias of 127. No floating point exceptions
 or interrupts may be supported. Denorms may be flushed to zero. NaN may be
 treated as infinity. Negative 0.0 may be treated as positive 0.0 in all comparisons.

The following rules of Table 8FF may apply.

35 Table 8FF

```

      0.0 * x = 0.0    for all x (including infinity)
      1.0 * x = x      for all x (including infinity and NaN)
      0.0 + x = x      for all x (including infinity and NaN)
40

```

Programming Examples

A plurality of program examples will now be set forth in Table 9.

Table 9

The #define statements are meant for a cpp run.

5

Example 1

10

```
%!VS2.0
; Absolute Value R4 = abs(R0)
```

```
MAX    R4,R0,-R0;
```

Example 2

15

```
%!VS2.0
; Cross Product      | i      j      k      | into R2
;                   | R0.x  R0.y  R0.z  |
;                   | R1.x  R1.y  R1.z  |
```

20

```
MUL  R2,R0.zxyw,R1.yzxw;
MAD  R2,R0.yzxw,R1.zxyw,-R2;
```

Example 3

25

```
%!VS2.0
; Determinant |R0.x R0.y R0.z| into R3
;             |R1.x R1.y R1.z|
;             |R2.x R2.y R2.z|
```

30

```
MUL  R3,R1.zxyw,R2.yzwx;
MAD  R3,R1.yzwx,R2.zxyw,-R3;
DP3  R3,R0,R3;
```

35 Example 4

40

```
%!VS2.0
; R2 = matrix[3][3]*v->onrm ,normalize and calculate
distance vector R3
```

```
#define INRM 11;    source normal
#define N0 16;      inverse transpose modelview row 0
#define N4 17;      inverse transpose modelview row 1
#define N8 18;      inverse transpose modelview row 2
```

45

```
DP3    R2.x,v[INRM],c[N0];
DP3    R2.y,v[INRM],c[N4];
DP3    R2.z,v[INRM],c[N8];
DP3    R2.w,R2,R2;
RSQ    R11.x,R2.w;
MUL    R2.xyz,R2,R11.x;
DST    R3,R2.w,R11.x;
```

50

Example 5

55

```
%!VS2.0
; reduce R1 to fundamental period
```

```

#define PERIOD 70;    location PERIOD is
1.0/(2*PI),2*PI,0.0,0.0

5          MUL  R0,R1,c[PERIOD].x;    divide by period
          FRC  R4,R0;
          MUL  R2,R4.x,c[PERIOD].y;  multiply by period

10  Example 6

      %!VS2.0
      ; matrix[4][4]*v->opos with homogeneous divide

15  #define IPOS  0;    source position
      #define M0   20;   modelview row 0
      #define M4   21;   modelview row 1
      #define M8   22;   modelview row 2
      #define M12  23;   modelview row 3

20          DP4  R5.w,v[IPOS],c[M12];
          DP4  R5.x,v[IPOS],c[M0];
          DP4  R5.y,v[IPOS],c[M4];
          DP4  R5.z,v[IPOS],c[M8];
          RCP  R11,R5.w;
25          MUL  R5,R5,R11;

      Example 7

      %!VS2.0
30      ; R4 = v->weight.x*R2 + (1.0-v->weight.x)*R3

      #define IWGT 11;    source weight

          ADD  R4,R2,-R3;
35          MAD  R4,v[IWGT].x,R4,R3;

      Example 8

      %!VS2.0
40      ; signum function R6 = R3.x>0? 1, R3.x==0? 0, R3.x<0? -1
      ; c[0] = (0.0,1.0,NA,NA)

          MOVc  CC,R3.x;
          SGT  R6,R3.x,c[0].x;
45          MOV  R6(LT),-c[0].y;

      Example 9

      %!VS2.0
50      ; subroutine call to index v[TEX3].x if v[TEX3].y > 0.0

          MOVc  CC.y,v[TEX3].y;
          ARL  A0.w,v[TEX3].x;
          CAL  GT.y,A0.w;
55
```

As mentioned earlier, various functions such as sine and cosine may be executed by the previous embodiment. In particular, such mathematical functions

are directly performed on the input data. It should be noted that the mathematical function is directly performed in the computer graphics pipeline without a texture look-up or significant or any aid from a central processing unit. More information will now be set forth regarding the manner in which one embodiment of the present invention is capable of directly executing such functions in a computer graphics pipeline such as that of Figure 1.

Figure 6 illustrates a method 600 for directly executing a function in a computer graphics pipeline. While the present method 600 may be carried in the context of the computer graphics pipeline of Figure 1 and more particularly the functional module 302 of Figure 3, it should be noted that any other type of dedicated graphics pipeline-application specific integrated circuit (ASIC) may be utilized per the desires of the user. Moreover, the method 600 need not be limited to a graphics pipeline. It can work just as well outside of the context of graphics.)

Initially, in operation 602, input data is received in a computer graphics pipeline. Such input data may include vertex data or any other data capable of being handled by the computer graphics pipeline.

Next, in operation 604, the particular function to be executed on the input data is identified. In one embodiment, the mathematical function may include a sine, cosine, or various other functions including, but not be limited to tangent, arctangent, exponentiation, logarithm, hyperbolic sine, hyperbolic cosine, hyperbolic tangent, and/or hyperbolic arctangent. Moreover, the input data may be in a floating-point format. It should be noted that the $\sin(x)$ and $\cos(x)$ functions may include an argument x that is in either degrees or radians.

Thus, in operation 606, pre-processing of the input data may be carried out based on the function to be executed on the input data utilizing the computer graphics pipeline. The purpose of the pre-processing is to convert the input data into a form that may be handled by general processing hardware that is used later,

regardless of the specific function to be utilized. More information regarding the pre-processing of operation 606 will be set forth in greater detail during reference to Figure 7.

5 Thereafter, in operation 608, the input data may be processed utilizing a plurality of operations independent of the function to be executed on the input data utilizing the computer graphics pipeline. As an option, the mathematical function may be performed utilizing a Taylor Series, a cordic algorithm, or any other type of algorithm. Still yet, the input data may be converted from a first coordinate system
10 to a second coordinate system (*e.g.*, Cartesian, cylindrical, spherical, etc.). Further, the mathematical function may be carried out in one cycle in the computer graphics pipeline. More information regarding the processing of operation 608 will be set forth in greater detail during reference to Figure 8.

15 Subsequently, in operation 610, post-processing may be carried out on the input data to generate output data utilizing the computer graphics pipeline. The purpose of the post-processing is to convert the general output of the general processing hardware to a form that may be handled by subsequent processes. More information regarding the post-processing of operation 610 will be set forth in
20 greater detail during reference to Figure 9.

 Finally, such output data may be stored in memory on the computer graphics pipeline. Note operation 612. Of course, such memory may include, but is not limited to any type of buffer memory or the like for storing the output for later use.

25

 It should be noted that the mathematical function is directly performed in the computer graphics pipeline. In other words, the pre-processing of operation 606, the processing of operation 608, and the post-processing of operation 610 are performed by the computer graphics pipeline, without a texture look-up or significant or any aid
30 from a central processing unit.

Figure 7 illustrates a method 700 for pre-processing input data, in accordance with operation 606 of Figure 6. While specific pre-processing is set forth herein, it should be noted that the pre-processing may include any operations capable of converting the input data into a form that may be handled by general processing hardware that is used in operation 608.

As shown, the input data is initially normalized in operation 702. As an option, such normalization includes altering the input data by a scaling bias. Next, various pre-processing is carried out based on the type of function that is to be executed.

In particular, it is determined in decision 704 whether the function is sine or cosine. If so, the pre-processing includes multiplying the input data by $(1/(2\pi) + 1.0)$. See operation 706. This ensures that the range of input data of $[0.0, 2.0\pi)$ is mapped to a range of $[1.0, 2.0)$. If the input data resides outside of the range of $[0.0, 2.0\pi)$, the integer portion of the input data may be ignored. As an option, the sign of the input data may be manipulated to position the input data in the appropriate quadrant. It should be understood that operation 706 may be executed with a precision high enough to permit an indication of the appropriate quadrant of the input data while retaining intra-quadrant accuracy.

Moreover, the pre-processing includes performing a conditional 1's complement operation on the input data. Note operation 708. In particular, the conditional 1's complement operation is conditioned on quadrant of the input. The purpose of such pre-processing is to exploit the symmetry of the sine and cosine functions and thus transform the general problem to that of always evaluating the function within a single quadrant.

It is then determined in decision 710 whether the function to be executed is a cosine. If so, the pre-processing includes adding a one (1) to the quadrant of the

input data in operation 712. The purpose of such pre-processing is to alter the quadrant of the input data so that it may be processed as if it were the subject of a sine function. Such operation as that of 712 is an optimization in the preferred embodiment.

5

Next, it is determined in decision 714 whether the function to be executed is exponentiation. If the function includes exponentiation, a barrel shift operation is performed on the input data. See operation 716. The purpose of such pre-processing is to denormalize the input into an integer and fractional portion, the fractional portion then serving as input to 608.

10

Figure 8 illustrates a method 800 for processing input data, in accordance with operation 608 of Figure 6. While specific processing is set forth herein, it should be noted that the processing may include any algorithm capable of executing the function in accordance with operation 608.

15

Initially, in operation 802, the processing may include extracting a set of most significant bits (msbs) and a set of least significant bits (lsbs) from a mantissa associated with the input data. It should be noted that the mantissa may be extracted as a component of the input data along with a sign and an exponent thereof. In one embodiment, the set of most significant bits may include a 6-bit set. Further, the set of least significant bits may include a 17-bit set. It should be noted that the number of least and most significant bits determines an accuracy of the output data, and further has ramifications in the contents of the tables.

25

Further, in operation 804, the processing may include conditionally adding a one (1) to the most significant bits. In particular, the addition operation is conditioned on the msb of the lsb set. In the embodiment of the previous paragraph, the corresponds to the msb of the 17-bit lsb set. The purpose of the addition operation is to best utilize the table entries by always accessing the table entry closest (absolute value) to the exact desired sample location.

30

As mentioned earlier, the processing may include calculating a Taylor Series. To accomplish this calculation, information is looked up in a plurality of tables in operation 806 corresponding to the most significant bits extracted in operation 802 as processed by 804. Such retrieved information may include a first n ($n=0, 1, 2$) derivatives corresponding to the most significant bits. As an option, the look-up operation may be based at least in part on the least significant bits in order to locate a closest table entry. In the alternative, larger tables may be utilized.

The first n (*i.e.* $n=2$) derivatives may then be summed in the Taylor Series utilizing the least significant bits extracted in operation 802, the calculation of which is conventionally known. Table GG illustrates the various derivatives, least significant bits, and the equation by which the Taylor Series is calculated. It should be noted that the sign extracted in operation 802 may also be used during the following calculations.

Table GG

$$f_0 = f(x)$$

$$f_1 = f'(x)$$

$$f_2 = f''(x)$$

$$h = \text{lsbs}$$

$$\text{sum} = f_0 + h/1! * f_1 + h^2/2! * f_2 + h^3/3! * f_3$$

As an option, the tables may be utilized based on the function to be executed on the input data. Moreover, the tables may be hard-coded or stored in random access memory for programming purposes. Still yet, the tables may be loaded at runtime.

It should be noted that the operations **802-808** entail the same functionality carried out by the same dedicated hardware, regardless of the function being carried out. Such dedicated hardware outputs the sign, the exponent, and the sum for post-processing in operation **610** of Figure 6.

5

Figure 9 illustrates a method **900** for post-processing input data, in accordance with operation **610** of Figure 6. While specific post-processing is set forth herein, it should be noted that the post-processing may include anything necessary to prepare the processed input data for output in accordance with operation **610**, based on the specific function executed in operation **608**.

10

Specifically, the sign, the exponent and the sum may be received from the method **800** of Figure 8 for output as the sign, exponent and the mantissa, respectively. Note operation **902**. It may further be determined if the presently executed function is either sine or cosine in decision **904**. If so, the sign, exponent and the mantissa may be converted into a floating point format in operation **906**. Further, in decision **908**, it may be determined if the presently executed function is a logarithm. If so, a barrel shifter operation may be performed similar to operation **716** of Figure 7.

15

20

The essence of post-processing **610** in the preferred embodiment is the conversion of fixed-point fractional data, as received from **608** into a floating-point format for storage in **612**. (Additional responsibilities of **610** are the detection of special cases, e.g., $\sin(\pm\text{inf}) \rightarrow \text{NaN}$, $\log(x)$, $x < 0 \rightarrow -\text{inf}$, $\sin(x)$, $x \approx 0 \rightarrow x$, etc.)

25

While various embodiments have been described above, it should be understood that they have been presented by way of example only, and not limitation. Thus, the breadth and scope of a preferred embodiment should not be limited by any of the above described exemplary embodiments, but should be defined only in accordance with the following claims and their equivalents.

30
